                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII', complex, PolIII', associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex. The final composition of the complex is: (alpha, epsilon, theta)[2]-tau[2]-(gamma, delta, delta', psi, chi)[2]-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention discloses isolated colon specific nucleic acids (CSNAs) and Ct the polypeptides (CSPAs) that they encode. The colon specific nucleic cc acids and polypeptides are useful as vaccines. The colon specific nucleic cc acid and polypeptide are also useful for diagnosing and monitoring the presence and metastases of colon cancer in a patient. The antibody that cspecifically binds to the colon specific polypeptide is useful for CC determining the presence of a colon specific protein in a sample, as well can specific acid molecule or polypeptide. In particularly by inducing an immune cresponse against the colon cancer cell expressing the colon specific concleic acid molecule or polypeptide. In particular, these colon specific cc genes and proteins are useful for identifying, diagnosing, monitoring, cstaging, imaging and treating colon cancer (e.g. colorectal cancer) and cc conor-cancerous disease states in the colon. These are also useful in gene cc therapy, production of transgenic animals and cells and in the production core of engineered colon tissue for treatment and research. The sequences presented in ABG90928-ABG90963 are the human CSPs encoded by the CSNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SXXC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                               liver (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded apptides of the invention.

Note: The sequence information for this patent does not appear in the
                                                                                                                                     The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult
                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              õ
                                                                                                                                                            The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present sequence is a protein encoded by one sucl probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, stagying, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI20459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used.
                                                                                            WPI;

They can be used to measure gene expression in bone marrow, which may enable the improved diagnosis and treatment of cancers lymphoma, leukaemia and myeloma. The present sequence is a encoded by one of the probes of the invention.

                                                     The present invention relates to single exon nucleic acid prosee AAI31315-AAI57546). The present sequence is a peptide enc such probe. The probes are useful for producing a microarray predicting, measuring and displaying gene expression in sampl from human placenta. The probes are useful for antenatal diag human genetic disorders.

Spatially-addressable set of single exon nucleic acid probes, used gene expression in human lung samples

Claim 27; SEQ ID No 29462; 634pp; English.

cc probes; the novel set of probes which hybridise at high stringency to a connected acid expressed in the human lung; measuring gene expression in a cc nucleic acid expressed in the human lung; measuring gene expression in a cc sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of cc the array; identifying exons in a eukaryotic genome, comprising cc (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably clabeled nucleic acids from eukaryote lung mRNA, to a single exon probe, chaving a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method cabove and (b) measuring the expression of each of the exons in several ctissues and/or cell types using hybridisation to a single exon probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising or of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 neurofibromatosis, tuberous sclerosis, particularly O.f

The invention relates to a substantially pure polypeptide comprising an amino acid sequence selected from Rv0284, Rv0285, Rv0455c, Rv0455c, Rv19569, Rv19569, Rv1986, Rv3477, Rv3878, Rv3879c or Mr3106.1 (also disclosed are ORF13A and Rv0284ct), or their immunogenic portion, nucleic acids encoding them and an amino acid sequence analogue having at least 70% sequence identity to the polypeptide and is immunogenic. The protein is useful in preparing a pharmaceutical composition for diagnosing tuberculosis and in preparing a vaccine against tuberculosis caused by virulent mycobacteria. The vaccine or immunogenic, pharmaceutical composition can be used prophylactically in a subject not infected with a virulent mycobacterium, or therapeutically in a subject already infected with a virulent mycobacterium. The protein is useful for preventing, treating and detecting infections caused by species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Mycobacterium tuberculosis antigens, useful for diagnosing tuberculosis, and as a vaccine for treating or preventing infections caused by species of tuberculosis complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Agger
                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3;

                                  cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                 The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating
                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
   treatment of inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tuberculosis complex (M. tuberculosis, M. bovis, M. africanum). The nucleic acids may be used for effecting in vivo expression of the antigen, and in diagnostic assays for detecting the presence of pathogenic organisms in a sample. The vaccine is an improvement of the living BCG vaccine presently available, where one or more copies of the DNA sequence encoding one or more polypeptide has been incorporated into the genome of the microorganism to allow the microorganism to express and secrete the polypeptide. Incorporation of more than one copy of a nucleotide sequence enhances the inmune response. The present sequence represents an immunogenic peptide derived from an M. tuberculosis protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytckine; cell proliferation; cell differentiation; vaccine; peptide therapy; stem cell growth factor; haematc tissue growth factor; humanomodulatory, cancer; leukaemia; nervous system disorders; arthritis; inflammation.
